Sentiment Analysis of Twitter/X Data

ShadowFox Data Science Internship — Intermediate Task

Tool Used: VADER Sentiment Analyzer

In [13]:
```
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
from vaderSentiment.vaderSentiment import SentimentIntensityAnalyzer
from wordcloud import WordCloud
import warnings
warnings.filterwarnings('ignore')
print("All libraries imported successfully!")
```

```
All libraries imported successfully!
```

In [14]:
```
df = pd.read_csv('twitter_data.csv')
print("Shape:", df.shape)
print("\nColumns:", df.columns.tolist())
print("\nFirst 5 rows:")
df.head()
```

```
Shape: (162980, 2)

Columns: ['clean_text', 'category']

First 5 rows:
```

Out[14]:

	clean_text	category
0	when modi promised “minimum government maximum...	-1.0
1	talk all the nonsense and continue all the dra...	0.0
2	what did just say vote for modi welcome bjp t...	1.0
3	asking his supporters prefix chowkidar their n...	1.0
4	answer who among these the most powerful world...	1.0

1. Data Exploration

In [15]:
```
# Check missing values and category distribution
print("Missing values:\n", df.isnull().sum())
print("\nCategory counts:\n", df['category'].value_counts())
print("\nCategory mapping: -1.0=Negative, 0.0=Neutral, 1.0=Positive")
```

```
Missing values:
 clean_text    4
category      7
dtype: int64

Category counts:
 category
 1.0    72250
 0.0    55213
-1.0    35510
Name: count, dtype: int64

Category mapping: -1.0=Negative, 0.0=Neutral, 1.0=Positive
```

2. Data Cleaning

In [16]:
```
# Drop missing values
df = df.dropna(subset=['clean_text'])

# Map category numbers to labels
df['sentiment'] = df['category'].map({-1.0: 'Negative', 0.0: 'Neutral', 1.0: 'Po

print("Data cleaned!")
print(df['sentiment'].value_counts())
```

```
Data cleaned!
sentiment
Positive    72249
Neutral     55211
Negative    35509
Name: count, dtype: int64
```

3. VADER Sentiment Analysis

In [17]:
```
# Initialize VADER
analyzer = SentimentIntensityAnalyzer()

# Apply VADER to each tweet
def get_vader_sentiment(text):
    score = analyzer.polarity_scores(str(text))
    if score['compound'] >= 0.05:
        return 'Positive'
    elif score['compound'] <= -0.05:
        return 'Negative'
    else:
        return 'Neutral'

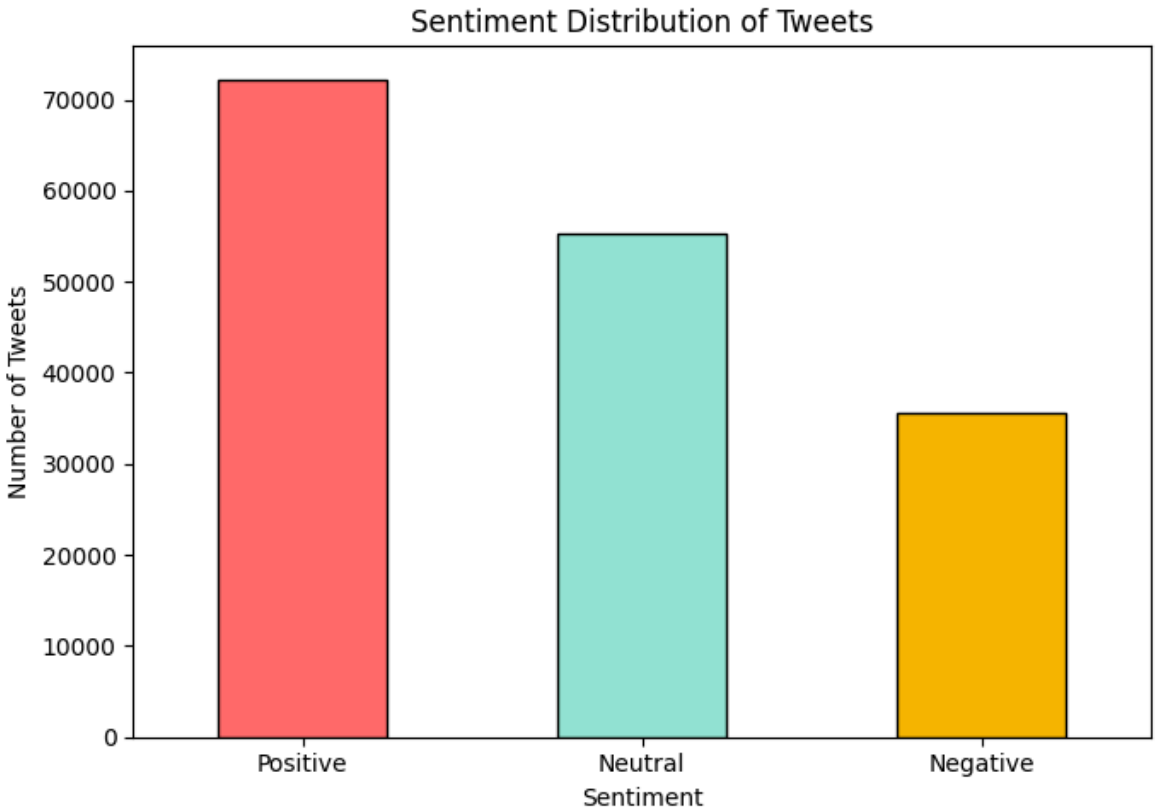
# Apply on sample of 10000 rows (full dataset is too large)
df_sample = df.sample(n=10000, random_state=42)
df_sample['vader_sentiment'] = df_sample['clean_text'].apply(get_vader_sentiment

print("VADER analysis complete!")
print(df_sample['vader_sentiment'].value_counts())
```

```
VADER analysis complete!
vader_sentiment
Positive    4712
Negative    3152
Neutral     2136
Name: count, dtype: int64
```

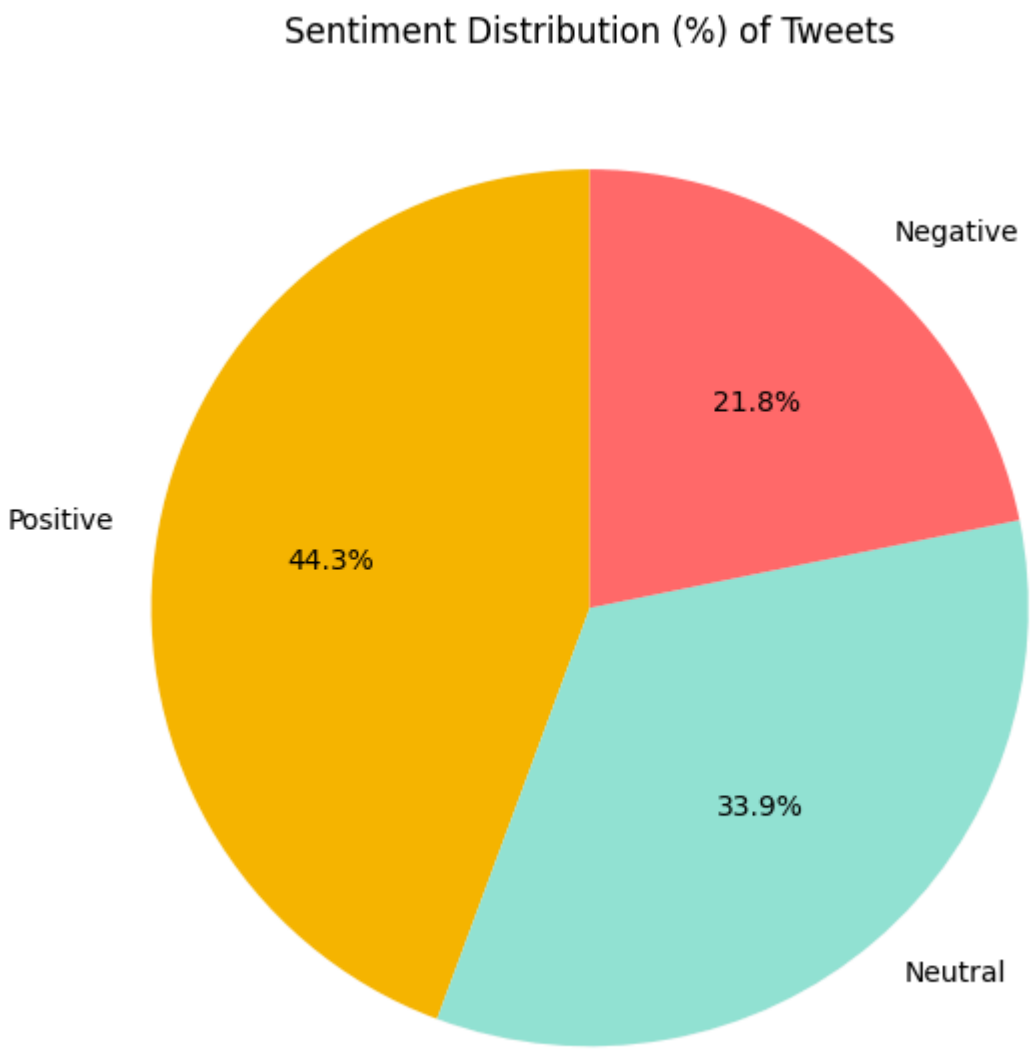
4. Visualizations

In [18]:
```
# Bar chart of sentiment distribution
plt.figure(figsize=(7, 5))
colors = ['#ff6b6b', '#95e1d3', '#f8b500']
df['sentiment'].value_counts().plot(kind='bar', color=colors, edgecolor='black')
plt.title("Sentiment Distribution of Tweets")
plt.xlabel("Sentiment")
plt.ylabel("Number of Tweets")
plt.xticks(rotation=0)
plt.tight_layout()
plt.show()
print("Total tweets analyzed:", len(df))
```



```
Total tweets analyzed: 162976
```

In [19]:
```
# Pie chart
plt.figure(figsize=(6, 6))
sizes = df['sentiment'].value_counts()
colors = ['#f8b500', '#95e1d3', '#ff6b6b']
plt.pie(sizes, labels=sizes.index, colors=colors,
        autopct='%1.1f%%', startangle=90)
plt.title("Sentiment Distribution (%) of Tweets")
plt.tight_layout()
plt.show()
```

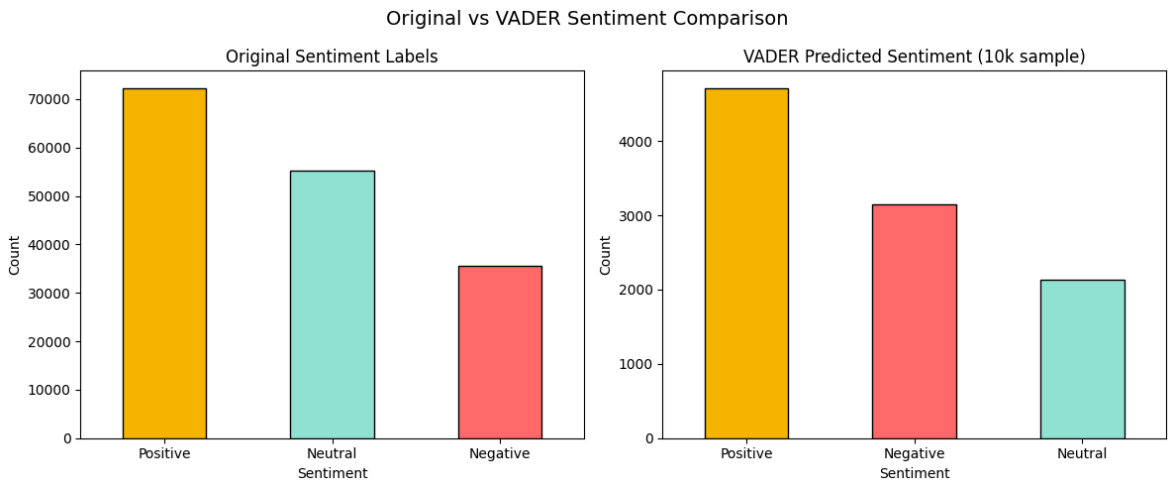


In [20]:
```
# Compare original vs VADER sentiment
fig, axes = plt.subplots(1, 2, figsize=(12, 5))

# Original labels
df['sentiment'].value_counts().plot(kind='bar', ax=axes[0],
    color=['#f8b500', '#95e1d3', '#ff6b6b'], edgecolor='black')
axes[0].set_title("Original Sentiment Labels")
axes[0].set_xlabel("Sentiment")
axes[0].set_ylabel("Count")
axes[0].tick_params(axis='x', rotation=0)

# VADER labels
df_sample['vader_sentiment'].value_counts().plot(kind='bar', ax=axes[1],
    color=['#f8b500', '#ff6b6b', '#95e1d3'], edgecolor='black')
axes[1].set_title("VADER Predicted Sentiment (10k sample)")
axes[1].set_xlabel("Sentiment")
axes[1].set_ylabel("Count")
axes[1].tick_params(axis='x', rotation=0)

plt.suptitle("Original vs VADER Sentiment Comparison", fontsize=14)
plt.tight_layout()
plt.show()
```



In [21]:
```
# Wordcloud for positive tweets
positive_text = ' '.join(df[df['sentiment'] == 'Positive']['clean_text'].dropna(

wordcloud = WordCloud(width=800, height=400,
                      background_color='white',
                      colormap='Greens').generate(positive_text)

plt.figure(figsize=(10, 5))
plt.imshow(wordcloud, interpolation='bilinear')
plt.axis('off')
plt.title("Most Common Words in Positive Tweets", fontsize=14)
plt.tight_layout()
plt.show()
```

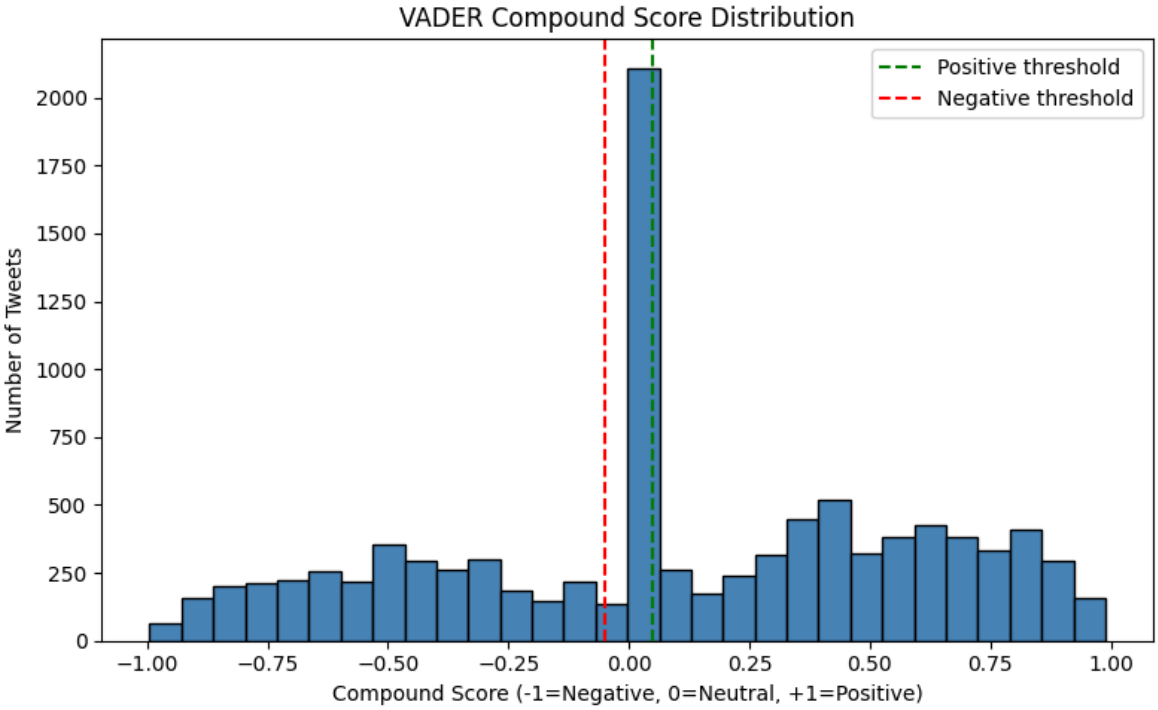
Most Common Words in Negative Tweets

In [23]:

```
# VADER compound score distribution
df_sample['compound_score'] = df_sample['clean_text'].apply(
    lambda x: analyzer.polarity_scores(str(x))['compound'])

plt.figure(figsize=(8, 5))
plt.hist(df_sample['compound_score'], bins=30,
         color='steelblue', edgecolor='black')
plt.title("VADER Compound Score Distribution")
plt.xlabel("Compound Score (-1=Negative, 0=Neutral, +1=Positive)")
plt.ylabel("Number of Tweets")
plt.axvline(x=0.05, color='green', linestyle='--', label='Positive threshold')
plt.axvline(x=-0.05, color='red', linestyle='--', label='Negative threshold')
plt.legend()
plt.tight_layout()
plt.show()
```



5. Conclusion

- Dataset contains 162,980 tweets with 3 sentiment categories
- Majority of tweets are Positive (44.3%) followed by Neutral (33.9%) and Negative (21.8%)
- VADER Sentiment Analyzer was applied on a sample of 10,000 tweets
- VADER predicted similar trend — more Positive tweets than Negative
- WordCloud shows common words used in Positive and Negative tweets
- VADER compound score distribution shows most tweets lean slightly Positive
